

# Low Power Zero-Drift Operational Amplifier with Internal Capacitors

## FEATURES

- Low Supply Current: 200 $\mu$ A
- No External Components Required
- Maximum Offset Voltage: 10 $\mu$ V
- Maximum Offset Voltage Drift: 0.1 $\mu$ V/ $^{\circ}$ C
- Single Supply Operation: 4.75V to 16V
- Input Common Mode Range Includes Ground
- Output Swings to Ground
- Typical Overload Recovery Time: 6ms

## APPLICATIONS

- 4mA to 20mA Current Loops
- Thermocouple Amplifiers
- Electronic Scales
- Medical Instrumentation
- Strain Gauge Amplifiers
- High Resolution Data Acquisition

## DESCRIPTION

The LTC<sup>®</sup>1049 is a high performance, low power zero-drift operational amplifier. The two sample-and-hold capacitors usually required externally by other chopper stabilized amplifiers are integrated on the chip. Further, the LTC1049 offers superior DC and AC performance with a nominal supply current of only 200 $\mu$ A.

The LTC1049 has a typical offset voltage of 2 $\mu$ V, drift of 0.02 $\mu$ V/ $^{\circ}$ C, 0.1Hz to 10Hz input noise voltage of 3 $\mu$ V<sub>P-P</sub> and typical voltage gain of 160dB. The slew rate is 0.8V/ $\mu$ s with a gain bandwidth product of 0.8MHz.

Overload recovery time from a saturation condition is 6ms, a significant improvement over chopper amplifiers using external capacitors.

The LTC1049 is available in a standard 8-pin plastic dual in line, as well as an 8-pin SO package. The LTC1049 can be a plug-in replacement for most standard op amps with improved DC performance and substantial power savings.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

## TYPICAL APPLICATION

Single Supply Thermocouple Amplifier

LTC1049 • TA01

**ABSOLUTE MAXIMUM RATINGS** (Note 1)

Total Supply Voltage ( $V^+$  to  $V^-$ ) ..... 18V  
 Input Voltage (Note 2) ..... ( $V^+ + 0.3V$ ) to ( $V^- - 0.3V$ )  
 Output Short-Circuit Duration ..... Indefinite

Operating Temperature Range .....  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$   
 Storage Temperature Range .....  $-65^{\circ}\text{C}$  to  $150^{\circ}\text{C}$   
 Lead Temperature (Soldering, 10 sec) .....  $300^{\circ}\text{C}$

Slew Rate	$R_L = 10\text{k}\Omega$ , $C_L = 50\text{pF}$		0.8		$\text{V}/\mu\text{s}$
Gain Bandwidth Product			0.8		MHz
Supply Current	No Load	●	200	300 450	$\mu\text{A}$ $\mu\text{A}$
Internal Sampling Frequency			700		Hz

## ELECTRICAL CHARACTERISTICS

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

**Note 2:** Connecting any terminal to voltages greater than  $V^+$  or less than  $V^-$  may cause destructive latch-up. It is recommended that no sources operating from external supplies be applied prior to power-up of the LTC1049.

**Note 3:** These parameters are guaranteed by design. Thermocouple effects preclude measurement of these voltage levels in high speed automatic test systems.  $V_{OS}$  is measured to a limit determined by test equipment capability.

**Note 4:** Current Noise is calculated from the formula:

$$I_N = \sqrt{2q \cdot I_b}$$

where  $q = 1.6 \cdot 10^{-19}$  Coulomb.

## APPLICATIONS INFORMATION

### ACHIEVING PICOAMPERE/MICROVOLT PERFORMANCE

#### Picoamperes

In order to realize the picoampere level of accuracy of the LTC1049, proper care must be exercised. Leakage currents in circuitry external to the amplifier can significantly degrade performance. High quality insulation should be used (e.g., Teflon™, Kel-F); cleaning of all insulating surfaces to remove fluxes and other residues will probably be necessary—particularly for high temperature performance. Surface coating may be necessary to provide a moisture barrier in high humidity environments.

Board leakage can be minimized by encircling the input connections with a guard ring operated at a potential close to that of the inputs: in inverting configurations, the guard ring should be tied to ground; in noninverting connections, to the inverting input. Guarding both sides of the printed circuit board is required. Bulk leakage reduction depends on the guard ring width.

#### Microvolts

Thermocouple effects must be considered if the LTC1049's ultralow drift is to be fully utilized. Any connection of dissimilar metals forms a thermoelectric junction producing an electric potential which varies with temperature (Seebeck effect). As temperature sensors, thermocouples exploit this phenomenon to produce useful information. In low drift amplifier circuits the effect is a primary source of error.

Connectors, switches, relay contacts, sockets, resistors, solder, and even copper wire are all candidates for thermal EMF generation. Junctions of copper wire from different manufacturers can generate thermal EMFs of 200nV/°C—twice the maximum drift specification of the LTC1049. The copper/kovar junction, formed when wire or printed circuit traces contact a package lead, has a thermal EMF of approximately 35μV/°C—300 times the maximum drift specification of the LTC1049.

Teflon is a trademark of Dupont.

Minimizing thermal EMF-induced errors is possible if judicious attention is given to circuit board layout and component selection. It is good practice to minimize the number of junctions in the amplifier's input signal path. Avoid connectors, sockets, switches, and relays where possible. In instances where this is not possible, attempt to balance the number and type of junctions so that differential cancellation occurs. Doing this may involve deliberately introducing junctions to offset unavoidable junctions.

### PACKAGE-INDUCED OFFSET VOLTAGE

Package-induced thermal EMF effects are another important source of errors. It arises at the copper/kovar junctions formed when wire or printed circuit traces contact a package lead. Like all the previously mentioned thermal EMF effects, it is outside the LTC1049's offset nulling loop and cannot be cancelled. The input offset voltage specification of the LTC1049 is actually set by the package-induced warm-up drift rather than by the circuit itself. The thermal time constant ranges from 0.5 to 3 minutes, depending on package type.

### LOW SUPPLY OPERATION

The minimum supply for proper operation of the LTC1049 is typically below 4.0V (±2.0V). In single supply applications, PSRR is guaranteed down to 4.7V (±2.35V) to ensure proper operation down to the minimum TTL specified voltage of 4.75V.

### PIN COMPATIBILITY

The LTC1049 is pin compatible with the 8-pin versions of 7650, 7652 and other chopper-stabilized amplifiers. The 7650 and 7652 require the use of two external capacitors connected to Pins 1 and 8 which are not needed for the LTC1049. Pins 1, 5, and 8 of the LTC1049 are not connected internally; thus, the LTC1049 can be a direct plug-in for the 7650 and 7652, even if the two capacitors are left on the circuit board.
